

AwraAI Testing Feedback

Tester: Biniyam Taye

Developer: Abdul

I finished testing the AwraAI app and overall, I really like it. Honestly, it's a **simple, clean, powerful app**, and most of the important features work really well.

I tested the main features and wrote down everything I found below. Some things are bugs, some are just suggestions for improving the user experience.

Voice-to-Text Testing

1- Amharic

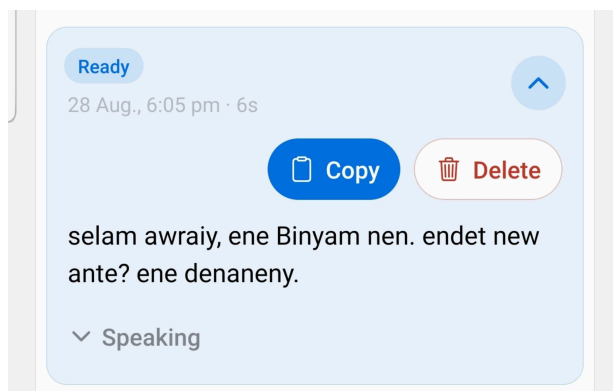

The normal Amharic transcription is **really good**. I tested it multiple times and the voice-to-text accuracy was impressive.

I didn't notice major missing words, and the punctuation also works very well.

2- Telegram Amharic

The Telegram Amharic feature needs more improvement.

The Amharic written using English/Latin letters is not always recognized accurately. I think this feature needs more training or improvement because users who use Telegram-style Amharic may expect better results.

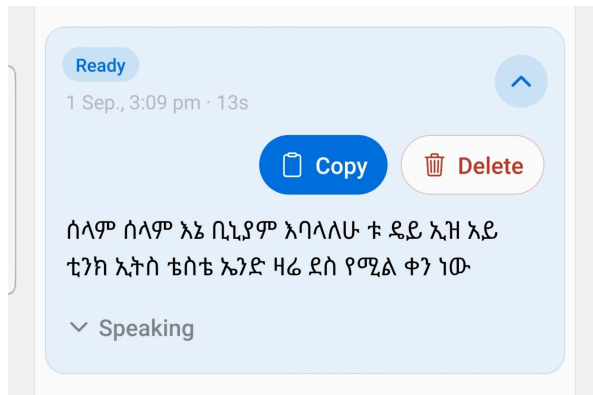

3 - Mixing Amharic + English

This is probably one of the biggest things I noticed.

When I speak using both **Amharic and English naturally in the same sentence**, it doesn't work properly. It mainly works with one language at a time.

For Ethiopian users especially, mixing Amharic and English is very common, so improving this could make the user experience much better.

❖ Different Speaking Speeds

I tested:

- Speaking slowly
- Normal speed
- Speaking fast

Everything worked well.

→ Text Accuracy

- Does voice convert to text?

Yes, it works properly.

-Missing words?

For normal Amharic and English, I didn't notice major missing words.

The main issue is with Telegram Amharic.

- Punctuation

Punctuation works **really well**.

Recording Tests

- **Recording starts correctly**

No problem here. Recording starts normally.

- Processing Speed

The transcription/loading response is a little slow sometimes.

It's not a serious problem and the app is still usable, but if there is a way to make the backend or processing faster, it would make the experience smoother.

Even a small improvement in response speed could make the app feel faster.

❖ Internet Connection Issue

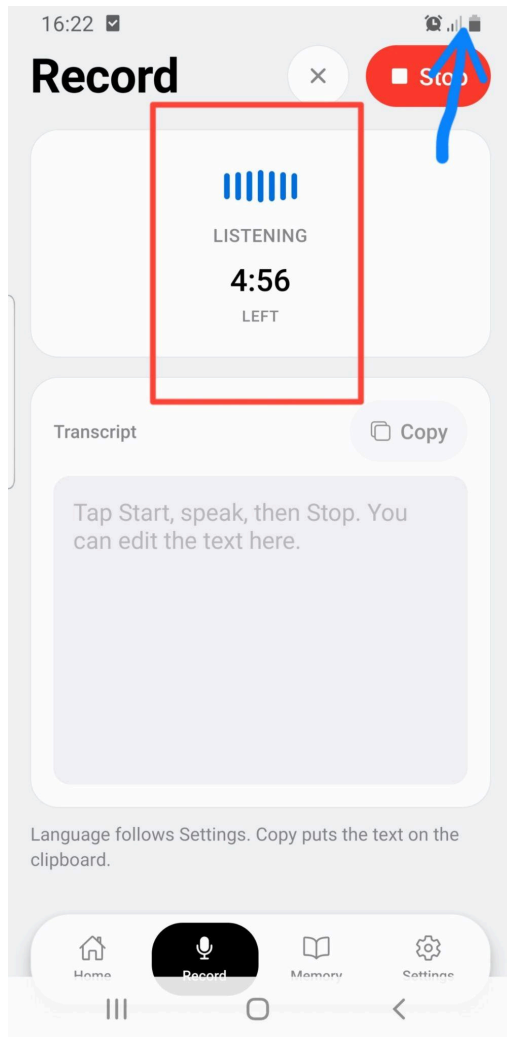

→ Internet turns off while recording

This is one important thing I found.

I started recording and then turned off the internet while speaking.

The app didn't immediately warn me. It allowed me to continue speaking, and only after I finished recording did it tell me there was no internet.

The problem is that a user could speak for several minutes and then find out that their recording cannot be processed. That could be frustrating and waste their time and energy.

- My suggestion:

As soon as the internet disconnects, show something like:

“No internet connection. Please reconnect before continuing.”

Or stop the recording and explain the problem immediately.

✗ Starting recording without internet

When I started with no internet, the app still allowed me to record.

After finishing, it showed the internet error.

I think it would be better to check the internet **before starting the recording**.

That would prevent users from recording something for a long time and then losing the result.

❖ **Background Recording**

-Switching to another app

When I started recording and switched to another app, the recording **stopped**.

This could be a problem for someone who wants to read a long message from Notes or another app while recording.

If background recording is technically possible, supporting it would be really useful.

-Lock Screen / Screen Off

When I started recording and locked the phone or turned off the screen, recording stopped.

Only the voice recorded while the screen was on was converted to text.

For long recordings, background recording while the screen is locked could be a nice improvement.

● **Phone Call Test**

When I received a phone call while recording:

- Recording stopped
- It didn't continue from where it stopped
- The previously recorded data was saved

This behavior makes sense because the phone call uses the microphone, but maybe the app could handle the interruption more clearly.

❖ Long Recording

✅ Long recordings

I tested longer recordings with:

- Normal Amharic
- English

Both worked well. 👍

Empty Recording

❌ Small issue

When I started recording without saying anything and then stopped it, the app sometimes produced "አዎ" as the result in Amharic or something like "

I tried it multiple times.

Maybe it would be better to show:

No speech detected

instead of generating random text.

❖ Buttons

– Most buttons

All the buttons I tested worked correctly.

– Logout Button Suggestion

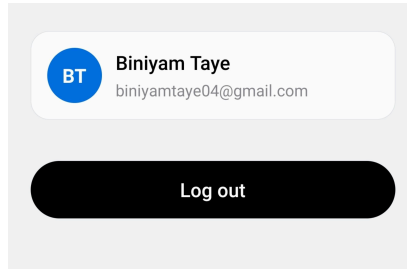

The logout button works, but there is no confirmation.

Maybe adding:

Are you sure you want to log out?

would prevent users from accidentally logging out.

Not a big problem, just a small UX suggestion.

❖ Google Login

– Google OAuth

Google login worked correctly. No problem here.

Floating Mic Over Apps

– One of my favorite features

Personally, I really like this feature.

I tested:

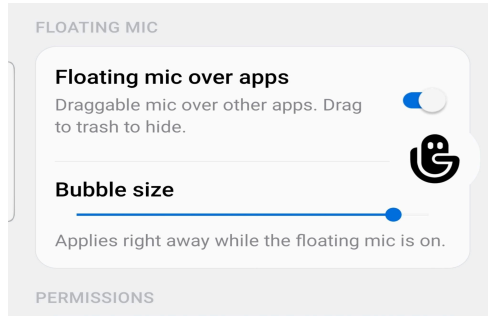

- Floating mic
- Moving the bubble
- Using it over other apps
- Dragging it around
- Dragging it to the trash to hide it

Everything worked perfectly.

– Bubble Size

The bubble size setting also worked perfectly.

Honestly, this feature is very nice.

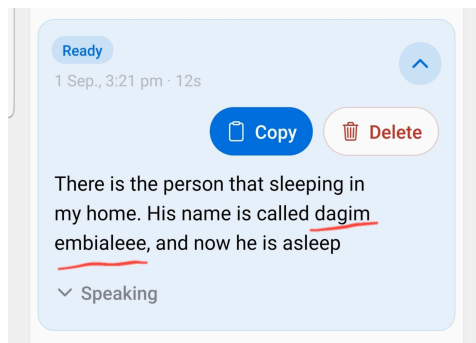

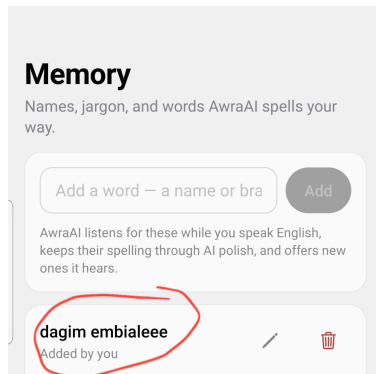

❖ Memory Feature

–Works perfectly

I tested adding and managing names and words.

Everything worked correctly.

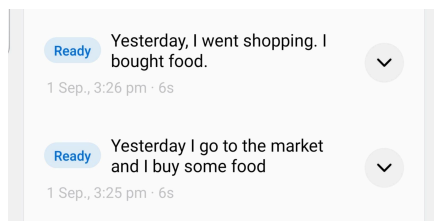

❖ English Polish

– Very Good

The English Polish feature works really well and improves the English text nicely.

Good feature.

Recording Sound Options

I tested:

- Whisper
- Soft Ping
- Crystal
- Warm Pop
- Silent

✓ Everything worked correctly.

As i mentioned only the telegram amharic in eng typo is not perfect exept that its good.

❖ Delete Account

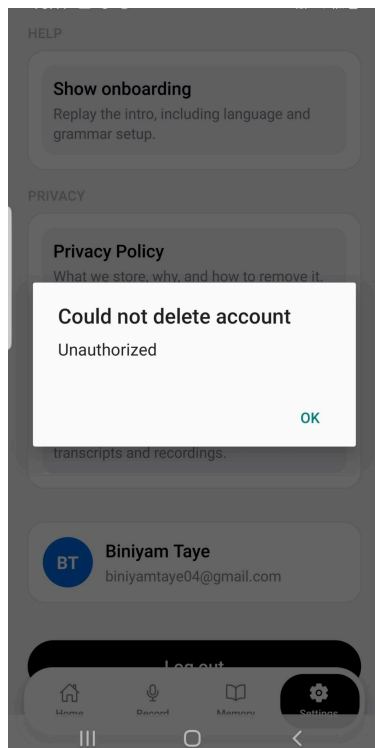

✗ Important Bug

When I tried to delete my account, it showed:

“ Unauthorized “

And my account was not deleted.

This probably needs to be checked because a logged-in user should be able to delete their own account.

❖ Privacy Policy & Terms

✅ Works correctly

Privacy Policy and Terms of Service successfully redirect to the website.

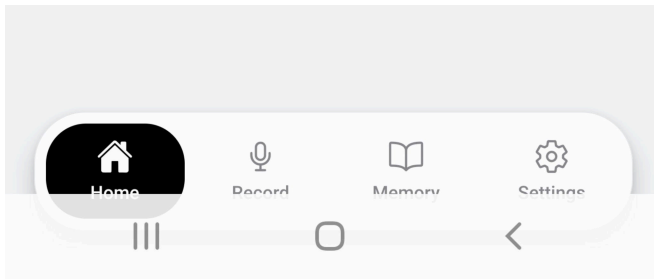

No problem there.

❖ Small UI Issues

– Bottom Navigation

The icons in the bottom navigation are slightly too close to/interfering with the phone's system navigation area.

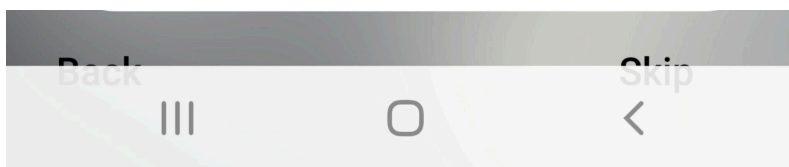

Maybe moving the app navigation slightly higher or adding more bottom spacing would improve it.

– Onboarding Skip&back Button

The **Skip and back** button during onboarding is also a little too close to the phone navigation area.

Adding some safe-area spacing would make it cleaner.

❖ Overall Thoughts

Honestly Abdul, I **really like the app**.

It's simple, clean, and powerful without having unnecessary complicated features. The main voice-to-text functionality works very well, especially for:

- ✓ Normal Amharic
- ✓ English
- ✓ Punctuation
- ✓ Different speaking speeds
- ✓ Long recordings
- ✓ Floating microphone
- ✓ Memory feature
- ✓ English Polish
- ✓ Google login
- ✓ Sound options

The biggest things I think would improve the app are:

1. Better **Telegram Amharic**
2. Support for **mixed Amharic + English**
3. Better handling of **no internet**
4. Background/locked-screen recording if possible
5. Fixing the **Delete Account Unauthorized** issue
6. Fixing empty recordings producing random text
7. A few small UI spacing improvements

Overall, I think **AwraAI is a really good and powerful app**.

The core features already work very well, and with a few improvements, especially around mixed languages and recording behavior, I think the user experience can become even better.

Good job big bro 🔥
